

2) Technology

My plans for upgrading technology skills....

Currently, I have a knowledge of **Java** because when we test any mobile app, secure website, or software Then it is necessary to know the fundamentals of automation testing in Java. However, in the current market, **JavaScript** is useful everywhere, including front-end, back-end, and also in testing.

Therefore, I'm curious to upgrade my testing skills in JavaScript as well as in **python**. Additionally, I want to learn to use different kind of **tools** that are useful for performance testing.

In simple words, I don't want to limit my mindset. I want to learn something new every day, whether it's a new testing technology or different testing technique.

Currently, I'm pursuing my Bachelor's degree. After completing that, I will apply for the **ISTQB** (Indian Software Testing Qualification Board) examination for international software testing certification.

#Now what I think about continuous learning and professional development

I believe that,

if I have a limited skill set, I become stagnant after some time. So, if I want continuous improvement in your life, then I have to keep learning.

"Learn something new every day, improve yourself by 1% each day, and one day you will achieve 100%."
